FOREWORD

This report on the T-38A High Temperature Evaluation was prepared by Clair K. Sandstrom and Billy L. White of the Flight Test Engineering Branch, Flight and Engineering Test Group, Wright Air Development Division (WADD), at the request of the Directorate of Systems Management, Airborne Support Systems Division, T-38 Support Systems Project Office under Systems Project Number 420L. Mr. Sandstrom was project engineer; Capt Russell L. Rogers, Air Force Flight Test Center, was the project pilot.

The high temperature tests were conducted at the El Centro Naval Auxiliary Landing Field (NALF), California, from 19 August through 5 September 1960.

The Flight and Engineering Test Group, WADD, directed the tests, provided the engineering and instrumentation personnel, and was responsible for final data reduction and analysis, and publication of the test results. Data for preliminary instrument flight procedures for the Flight Manual were also gathered during the desert tests and will be published in a separate report by the Flight Test Engineering Branch. Operational information influenced by desert climates is presented in paragraph 25 of "Recommendations" as proposed additions to Section IX of the applicable flight handbook, T.O. T-38A-1.

The Air Force Flight Test Center (AFFTC), Edwards Air Force Base, California, provided the project pilot, supply support, and maintenance personnel. The El Centro NALF provided limited base support.

Technical representatives of Norair Division, Northrop Aircraft Corporation, Hawthorne, California, and General Electric Corporation participated in the test. The T-38A "Talon" (USAF S/N 59-1590) aircraft was designed and manufactured by Norair; instrumentation pick-ups and leads were installed by Northrop during production in accordance with military specification MIL-I-5289(ASG) as amended by WADD. The aircraft was powered by two YJ85-GE-5 eight-stage axial-flow turbojet engines. Additional instrumentation and the necessary recording equipment were installed in the aircraft at Edwards Air Force Base, California, prior to the El Centro tests, by WADD instrumentation personnel, with shop support furnished by AFFTC.

ABSTRACT

The T-38A aircraft was subjected to flight and static tests at ambient temperatures up to 115°F at the El Centro Naval Auxiliary Landing Field, California. No serious deficiencies were encountered. The cockpit temperatures were unsatisfactory; however, the refrigeration package in the test aircraft was not a production unit and is to be replaced by a more efficient unit in the production aircraft.

Tests proved maintenance of the aircraft in a desert climate presents no unusual problem, but strict adherence to operational procedures, as affected by high temperatures, is necessary.

INTRODUCTION

GENERAL

1. High temperature tests of a T-38 "Talon" aircraft (USAF S/N 59-1596), Figure 1 (frontispiece), were conducted at El Centro Naval Auxiliary Landing Field, El Centro, California. Objectives of the tests were to:

- a. Determine the adequacy of the aircraft systems and components for functioning under high temperature climatic conditions.
- b. Analyze high temperature deficiencies discovered and make recommendations for corrective action.
- c. Determine desert operating procedures to be included in Section IX of the applicable flight handbook, T. O. T-38A-1.
- d. Compile environmental data for design purposes.

2. Flight tests were designed to subject the aircraft to the most extreme temperature conditions (ambient temperatures to 115°F) which may reasonably be expected while operating in desert climates. Ground tests were conducted to obtain data in two different areas, (1) to determine the effects of high temperatures and solar heat on the aircraft, its systems and components, and (2), to determine the maximum temperature during normal engine checkouts.

3. Systems and components of the aircraft presented no problems which can be directly or indirectly attributed to high temperatures.

DESCRIPTION OF THE TEST AIRCRAFT

4. The T-38A aircraft is a twin engine, two-place tandem trainer designed for speeds in the supersonic range. The mission of the aircraft is to accomplish all phases of basic pilot training, including day and night transition, formation, navigation, and adverse weather flying. The T-38A employs a low, thin wing; a movable, horizontal stabilizer; and fuselage lines characterized by distinct reverse curvature in the area of the wing root in conformance with the "area rule" concept. The crew normally consists of a student pilot and an instructor; the aircraft can be flown solo from either cockpit.

5. The test aircraft had a basic weight of approximately 7760 pounds with an internal fuel capacity of 3640 pounds. For this test, the weight of the fully loaded aircraft, two crew members, 3640 pounds of fuel, and instrumentation recording equipment, was 11,800 pounds.

6. The YJ85-GE-5 engines, mounted nearly parallel to each other and near the center line of the aircraft, comprise an axial-flow eight-stage compressor coupled directly to

a two-stage turbine. The engine incorporates a variable area inlet-guide vane system, a controlled compressor interstage bleed, an afterburner with a variable area exit nozzle, and employs a direct impingement type starting system.

TEST INSTRUMENTATION

7. Basic instrumentation included most of the thermocouples and transducers for the temperature and pressure pick-ups with all the necessary wiring leading from the pick-ups to the rear cockpit. The recording equipment, installed in the rear cockpit, included six switch boxes, a balance box, a junction box, and a digitizer equipped with a tape transport for recording. Most of the equipment was placed in the rudder pedal wells, which permitted an observer in the aft cockpit for all test flights. (The control stick and rudder pedals had been removed prior to the delivery of the aircraft to facilitate the installation of the recording system).

8. The flight test engineer controlled the recording system from a control panel mounted in the rear cockpit. During engine starts, the controls were set on "continuous" and only the first two switch boxes were used to get engine start data since they contained all of the engine parameters. This gave a repeating cycle every four seconds for any one parameter. When all six of the 30 position switch boxes were used, each parameter was sampled once every 12 seconds since the digital recording system has the capability of recording 180 parameters in 12 seconds. Throughout the test, the recording system was cycled at one-minute intervals during stabilized conditions, and operated continuously during transient conditions.

9. A total of 119 parameters including 77 temperatures, 28 pressures, and 14 miscellaneous measurements were recorded by the digital recording system. A complete listing of the instrumentation is included in Appendix A.

10. Solar radiation was measured by an Epply pyrhelimeter coupled to a modified Brown milli-volt recorder. The pyrhelimeter is sensitive to those factors such as cloud coverage, moisture, and dust, which affect the amount of solar heat reaching the test aircraft. Mounted on the platform adjacent to the pyrhelimeter were ten thermocouples which included one shaded, two with black metal discs, and seven unshielded. (See Figure 2 of Appendix C for the exact locations.) The thermocouples were positioned to record the ambient temperatures around the test aircraft from ramp level up to six feet above the ramp.

GENERAL

1. High temperature tests of a T-38 "Talon" aircraft (USAF S/N 59-1596), Figure 1 (frontispiece), were conducted at El Centro Naval Auxiliary Landing Field, El Centro, California. Objectives of the tests were to:

- a. Determine the adequacy of the aircraft systems and components for functioning under high temperature climatic conditions.
- b. Analyze high temperature deficiencies discovered and make recommendations for corrective action.
- c. Determine desert operating procedures to be included in Section IX of the applicable flight handbook, T. O. T-38A-1.
- d. Compile environmental data for design purposes.

2. Flight tests were designed to subject the aircraft to the most extreme temperature conditions (ambient temperatures to 115°F) which may reasonably be expected while operating in desert climates. Ground tests were conducted to obtain data in two different areas, (1) to determine the effects of high temperatures and solar heat on the aircraft, its systems and components, and (2), to determine the maximum temperature during normal engine checkouts.

3. Systems and components of the aircraft presented no problems which can be directly or indirectly attributed to high temperatures.

DESCRIPTION OF THE TEST AIRCRAFT

4. The T-38A aircraft is a twin engine, two-place tandem trainer designed for speeds in the supersonic range. The mission of the aircraft is to accomplish all phases of basic pilot training, including day and night transition, formation, navigation, and adverse weather flying. The T-38A employs a low, thin wing; a movable, horizontal stabilizer; and fuselage lines characterized by distinct reverse curvature in the area of the wing root in conformance with the "area rule" concept. The crew normally consists of a student pilot and an instructor; the aircraft can be flown solo from either cockpit.

5. The test aircraft had a basic weight of approximately 7760 pounds with an internal fuel capacity of 3640 pounds. For this test, the weight of the fully loaded aircraft, two crew members, 3640 pounds of fuel, and instrumentation recording equipment, was 11,800 pounds.

6. The YJ85-GE-5 engines, mounted nearly parallel to each other and near the center line of the aircraft, comprise an axial-flow eight-stage compressor coupled directly to

Manuscript released by the author 1 December 1960 for publication as a WADD Technical Note.

a two-stage turbine. The engine incorporates a variable area inlet-guide vane system, a controlled compressor interstage bleed, an afterburner with a variable area exit nozzle, and employs a direct impingement type starting system.

TEST INSTRUMENTATION

7. Basic instrumentation included most of the thermocouples and transducers for the temperature and pressure pick-ups with all the necessary wiring leading from the pick-ups to the rear cockpit. The recording equipment, installed in the rear cockpit, included six switch boxes, a balance box, a junction box, and a digitizer equipped with a tape transport for recording. Most of the equipment was placed in the rudder pedal wells, which permitted an observer in the aft cockpit for all test flights. (The control stick and rudder pedals had been removed prior to the delivery of the aircraft to facilitate the installation of the recording system).

8. The flight test engineer controlled the recording system from a control panel mounted in the rear cockpit. During engine starts, the controls were set on "continuous" and only the first two switch boxes were used to get engine start data since they contained all of the engine parameters. This gave a repeating cycle every four seconds for any one parameter. When all six of the 30 position switch boxes were used, each parameter was sampled once every 12 seconds since the digital recording system has the capability of recording 180 parameters in 12 seconds. Throughout the test, the recording system was cycled at one-minute intervals during stabilized conditions, and operated continuously during transient conditions.

9. A total of 119 parameters including 77 temperatures, 28 pressures, and 14 miscellaneous measurements were recorded by the digital recording system. A complete listing of the instrumentation is included in Appendix A.

10. Solar radiation was measured by an Epply pyrliometer coupled to a modified Brown milli-volt recorder. The pyrliometer is sensitive to those factors such as cloud coverage, moisture, and dust, which affect the amount of solar heat reaching the test aircraft. Mounted on the platform adjacent to the pyrliometer were ten thermocouples which included one shaded, two with black metal discs, and seven unshielded. (See Figure 2 of Appendix C for the exact locations.) The thermocouples were positioned to record the ambient temperatures around the test aircraft from ramp level up to six feet above the ramp.

TEST PROCEDURES AND RESULTS

FLIGHT TEST SUMMARY

Foreign Object Damage

11. The engines are started with an external air supply. Engine starting is accomplished by direct impingement of low-pressure air on the second-stage turbine wheel of the two-stage engine rotor.

12. Periodic inspection subsequent to the desert test showed that the turbine sections of both engines had suffered foreign object damage. No damage whatsoever was discovered in the compressor sections. It appeared that either the small baffles from the

first-stage turbine or foreign objects had entered the turbine section causing the damage. The foreign objects may have been forced into the first stage of the turbine through the starter air ducts. As the engine started motoring, air from the engine compressor would have forced the objects back through both sections of the turbines. The objects damaged turbine nozzles, blades, and partitions. On the day before the final ground engine run, a violent wind storm had occurred, in which quantities of sand and pebbles were blown around extensively. Some of these may have entered the duct of the MA-1 starting unit. As it is not common practice to inspect or blow out this duct before attaching the MA-1 unit to the starter air duct receptacle, it is likely that the foreign objects entered the engines in this manner.

Accessory Power Shaft Failure

13. Immediately after the flight on 22 August, a turn-around flight had to be abandoned because of a failure in the hydraulic system due to shearing of the radial shaft in the engine driven accessory gearbox. (The engine mounted accessories are driven from an accessory gearbox on the under side of the engine. The gearbox is driven by a radial shaft from the engine rotor. One of the drive pads on the accessory gearbox of each engine drives an airframe mounted accessory power assembly which consists of a two-speed automatic shifting gearbox. Each gearbox drives a generator and hydraulic pump. The two-speed gearboxes shift automatically during engine acceleration or deceleration to maintain a safe operating speed for the generators and hydraulic pumps.) When the left engine was started the generator caution light remained on and there was no hydraulic pressure in the left hydraulic system. Subsequent investigation revealed that the radial shaft (P/N 741C-872) in the engine driven accessory gearbox had sheared. The malfunction apparently had been caused by the failure of the two-speed gearbox to shift down during engine shut-down after the previous flight. The failure was not a high temperature fault and has happened frequently on other T-38 aircraft. The gearbox was removed during the periodic inspection and thoroughly examined. There were no faults or maladjustments found. The contractor has had serious quality control problems with this particular vendor and has changed vendors.

GROUND TEST SUMMARY

Static Temperature Survey

14. The static temperature surveys were conducted during two weekend periods. The first, on 20-21 August, was compromised to some extent by light winds and clouds. The second period, on 26, 27, 28 August, represented more extreme conditions. Selected data from the latter test are presented in Appendix C. The solar radiation and ambient air temperatures are plotted for all three days as shown in Figures 3 through 6 of Appendix C.

15. For the static temperature survey, the aircraft was parked on the ramp away from buildings or other obstructions which would cast shadows. The aircraft was parked with its longitudinal axis oriented in the north-south direction; cockpit canopies were closed and locked for the entire heat-soak period to obtain the maximum cockpit temperatures under the most extreme conditions. Temperature data were recorded at 30-minute intervals from 0700 to 1800 hours and at 60-minute intervals from 1800 to 0700 hours. No covers were used on the canopies.

16. Analysis of the data presented in Appendix C shows that the maximum temperature of 160°F occurred in the upper fuselage and in the cockpit area where the effects of solar radiation are greatest.

17. Comparison of the data over the complete soak period indicates that little or no heat is retained in the aircraft or aircraft systems from one day to the next. Therefore, opening or closing the aircraft in the evening will have no effect on the peak temperatures on the following day.

18. No unusual problems are anticipated if the aircraft is kept closed during high temperature periods. It would be advisable, however, to vent the aircraft when weather conditions permit, to reduce the temperatures within the aircraft. Normal high temperature problems associated with increased deterioration of rubber materials, plastics, and lubricants may be expected along with minor thermal stress.

Ground Engine Run

19. The engines were operated at various stabilized speeds from idle to maximum power with afterburners to determine the maximum temperatures which may be expected to occur in the aircraft compartments and systems during normal desert ground engine checkouts. Although high temperatures were reached, none of them appeared to be excessive. The engine run data does not appear in this report but is available from the originator upon request.

CONCLUSIONS

20. No serious deficiencies were encountered during the tests that could be attributed to high temperature operations. Maintenance of the aircraft in a desert climate presented no unusual problems; therefore, the aircraft may be considered suitable for desert-type operation such as encountered in the test area.

RECOMMENDATIONS

21. The following recommendations are based on the results of the high temperature functional evaluation tests conducted on the T-38A aircraft at El Centro NALF:

a. Eliminate the possibility of foreign objects entering the starting unit hose by placing a screening device in the adapter between the starting unit hose and the starter air duct receptacle of the engine. (Reference paragraph 12).

b. Include the Desert Operating Procedures, which follow, in Section IX of the applicable flight handbook, T. O. T-38A-1.

DESERT AND HOT WEATHER PROCEDURES

22. Hot weather and desert procedures differ from normal procedures mainly in that additional precautions must be taken to protect the aircraft from damage caused by high temperatures and dust. Particular care should be taken to prevent the entrance of sand into the various aircraft components and systems (engine, fuel system, pitot-static systems, etc.). All filters should be checked more frequently than under normal conditions. Units with plastic or rubber parts should be protected as much as possible from wind-blown sand and excessive temperatures. Canopy covers should be left off to prevent sand from entering between the cover and the canopy and acting as an abrasive on the plastic.

Heat buildup under closed canopy will not damage cockpit at runway temperatures of 110°F or less.

Before Entering Aircraft

NOTE: All metal surfaces exposed to the sun will be extremely hot to the touch, and gloves should be worn during preflight inspections.

1. Check exposed portions of shock strut pistons for dust and sand and have them cleaned if necessary.
2. Check inflation of shock struts and hydraulic accumulators which may have become over-inflated due to temperature increases.
3. Check tires carefully for improper inflation and blistering or cord separation.
4. Be sure all protective covers are removed from aircraft.
5. Check intake duct for accumulations of dust or sand.
6. Make sure all filters have been cleaned and that the aircraft has been thoroughly inspected for fuel or hydraulic leaks caused by the swelling of packings or expanding of fittings.
7. Inspect area behind aircraft to make sure sand or dust will not be blown onto personnel or equipment during starting operations.
8. Check starting unit duct for accumulations of small stones and sand.

On Entering Aircraft

1. Check cockpit for accumulation of dust or sand.
2. Check instruments and controls for moisture from high humidity, and apply heat if necessary, to dry them.

NOTE: All items in the cockpit that have been exposed to the sun are extremely hot to touch unless the cockpit has been protected by a canopy sun shade.

Ground Operation

1. Normal starting procedures are used in hot weather.
2. Expect the engines to accelerate more slowly than on a normal or cold day.
3. Ground checking should be complete but accomplished as rapidly as possible.
4. Limit use of brakes as much as possible during taxi operation to prevent overheating.

Takeoff

CAUTION: Takeoff planning is very important with high ambient temperatures and runways of marginal length. Takeoff distance will be longer because the air is less dense and ground speed will be increased for the same indicated airspeed. The refusal speed and distance, and the speed and distance checks should be carefully calculated.

1. To prevent additional drag caused by excessive angle of attack, the nose should not be lifted off until slightly below the recommended rotation speed.
2. Hot weather operation requires the pilot to be cautious of gusts and wind shifts near the ground.

During Flight

1. During high altitude flight the windshield and canopy defrost system should be operated at the highest possible temperature consistent with the crew members' comfort. This will preheat the transparent surfaces, thus precluding the formation of frost or fog during descent.

Approach and Landing

1. Check very closely and maintain recommended indicated approach and touchdown speeds. Because of high outside air temperatures, speed relative to the ground is higher than normal.
2. Anticipate a long landing roll due to higher ground speed at touchdown.
3. Use all available runway for stopping to avoid overheating the brakes.

Before Leaving Aircraft

1. Make sure that the protective cover is installed immediately on the pitot boom.

NOTE: Engine intake and exhaust duct covers should not be installed before normal engine cool-down period.

APPENDIX A

INSTRUMENTATION SUMMARY

The T-38A test aircraft's basic instrumentation was installed during production by the Norair Division of the Northrop Corporation in accordance with military specification MIL-I-5289(ASG) as amended by WADD. The aircraft was instrumented under the concept of selective instrumentation in order to keep the total number of pick-ups to a minimum.

Essentially, the instrumentation recorded data from the left engine, the hydraulic system, the air-conditioning system, the fuel system, the electrical system, and flight parameters. A total of 119 parameters including 77 temperatures, 28 pressures, and 14 miscellaneous measurements were recorded by the digital recording system mounted in the rear cockpit of the aircraft.

The data were recorded at various rates depending on the information required. During engine starts the controls were set on "continuous" and only the first two switch boxes were used to get engine "start" data, with a repeating cycle for any one parameter every four seconds. When all six of the 30-position switch boxes were used, each parameter was sampled once every 12 seconds. Throughout the test, during stabilized conditions the recording system was cycled at one-minute intervals, and during transient conditions the system was operated continuously.

A list of the instrumentation parameters, with switch box positions and corresponding ranges, is included in Table 1 of this appendix.

APPENDIX B

DESCRIPTION OF FLIGHTS

GENERAL

Eleven flight tests were made to determine the extreme high temperature operating limits which can be expected to occur throughout the aircraft and to obtain preliminary instrument flight procedures for the aircraft. Temperatures and pressures which occur in the hydraulic oil, engine oil, fuel, and air-conditioning systems were monitored by instrumentation recording equipment to determine their operating limits. In addition to determining extremes, several flights were devoted to normal high temperature operation and design missions to establish an envelope of expected normal desert operating conditions for inclusion in Section IX of the Flight Manual. Preliminary instrument procedures for takeoff, climb, holding, jet penetration, low approach, GCA, and missed approach were also developed during the test period. All but one test flight were flown during the hottest portion of the day. A weather station temperature of 105°F coupled with a solar radiation of 310 btu/sq ft/hr was established as the desired test minimums. The 105°F minimum temperature was obtained on most flights, although, due to the calendar time of the test, the solar radiation was below the desired maximum. A ground temperature survey was conducted prior to each flight which consisted of at least a four-hour heat soak.

Table 2

HIGH TEMPERATURE FLIGHT CONDITIONS

FLIGHT TEST NR 1 (ADVERSE WEATHER PROCEDURES)

DATE: 19 Aug 60
FLT. TIME: 70 Minutes

MAX. AMBIENT TEMPERATURE: 109°F
T/O AMBIENT TEMPERATURE: 109°F

OBJECTIVE: To accomplish an inflight temperature survey of various subsystems at an altitude of 20,000 feet, an instrument takeoff (ITO), a ground controlled approach (GCA), and a single engine saw-tooth descent.

COMMENT: A simulated instrument takeoff was made using VFR takeoff procedures. At 20,000 feet the right engine was shut down and a descent made to simulate a single engine penetration. A GCA was simulated utilizing a closed airfield.

FLIGHT TEST NR 2 (MISSION 2, SUPERSONIC TRAINING)

DATE: 22 Aug 60
FLT. TIME: 75 Minutes

MAX. AMBIENT TEMPERATURE: 106°F
T/O AMBIENT TEMPERATURE: 106°F

OBJECTIVE: To provide normal systems operating data and to evaluate the air-conditioning and pressurization systems. Adverse weather flight procedures and techniques were practiced at the end of the mission.

Table 2 (Cont'd)

FLIGHT TEST NR 2 (MISSION 2, SUPERSONIC TRAINING) (Cont'd)

COMMENT: An instrument takeoff and a military power climb to 40,000 feet were accomplished. The airspeed was stabilized at .88 Mach for 15 minutes. The aircraft was then accelerated to its maximum power and held for 10 minutes. A holding pattern, descent in a holding pattern, penetrations from 20,000 feet, and a GCA were made before returning to the El Centro NALF.

FLIGHT TEST NR 3 (ADVERSE WEATHER PROCEDURES)

DATE: 24 Aug 60 (FIRST FLT.)	MAX. AMBIENT TEMPERATURE 104°F
FLT. TIME: 90 Minutes	T/O AMBIENT TEMPERATURE 104°F
T/O ROLL: 2600 Ft	LANDING ROLL: 3350 Ft

OBJECTIVE: To accomplish a high-speed temperature survey at low altitude, instrument takeoff, two holding penetrations, and two GCA approaches.

COMMENT: An instrument takeoff was conducted in the same manner as previous flights except that A/B operation was maintained longer than before. A holding pattern was performed at 30,000 feet and a penetration was made at an altitude of 20,000 feet. Missed approach procedures were practiced along with two GCA approaches.

FLIGHT TEST NR 4 (MISSION 4, NIGHT FLIGHT)

DATE: 24 Aug 60 (SECOND FLT.)	MAX. AMBIENT TEMPERATURE: 91°F
FLT. TIME: 90 Minutes	T/O AMBIENT TEMPERATURE: 91°F
T/O ROLL: 2550 Ft	LANDING ROLL: 2950 Ft

OBJECTIVE: To perform a temperature survey after sundown. Its purpose was to determine the effects of solar radiation on air-conditioning requirements.

COMMENT: The previously developed instrument takeoff and climb techniques were applied to night operations and found acceptable. After climb to 30,000 feet the aircraft was accelerated to and held at its maximum airspeed for 10 minutes. It was then decelerated to and held at its maximum endurance airspeed for 15 minutes. A holding pattern, penetration, and a GCA were performed as in previous flights.

FLIGHT TEST NR 5 (MISSION 1, LOW ALTITUDE)

DATE: 25 Aug 60 (FIRST FLT.)	MAX. AMBIENT TEMPERATURE: 100°F
FLT. TIME: 90 Minutes	T/O AMBIENT TEMPERATURE: 97°F
T/O ROLL 2600 Ft	LANDING ROLL: 3250 Ft

OBJECTIVE: To provide extreme and normal operating data on the various aircraft systems at both high and low altitudes. Penetrations and VOR approaches using GCA procedures were made at the end of the low altitude portion of the test.

Table 2 (Cont'd)

FLIGHT TEST NR 5 (MISSION 1, LOW ALTITUDE) (Cont'd)

COMMENT: After an instrument takeoff and climb to 35,000 feet, power was reduced to best cruise airspeed and held for 10 minutes followed by 15 minutes at maximum endurance airspeed. Following a maximum rate of descent to 700 feet, the aircraft was held at military power at this altitude for 10 minutes. Adverse weather procedures were practiced at the end of the test run.

FLIGHT TEST NR 6 (ADVERSE WEATHER PROCEDURES)

DATE: 25 Aug 60 (SECOND FLT.)	MAX. AMBIENT TEMPERATURE: 95°F
FLT. TIME: 90 Minutes	T/O AMBIENT TEMPERATURE: 95°F
T/O ROLL: 2600 Ft	LANDING ROLL: 3600 Ft

OBJECTIVE: To accomplish an instrument takeoff followed by a single engine penetration, GCA, VOR, and missed approach.

COMMENT: All of the single engine procedures were worked out on this flight. The Yuma VOR and LF stations were used to develop adverse weather procedures.

FLIGHT TEST NR 7 (MISSION 3, HIGH SPEED)

DATE: 29 Aug 60	MAX. AMBIENT TEMPERATURE: 108°F
FLT. TIME: 80 Minutes	T/O AMBIENT TEMPERATURE: 108°F
T/O ROLL: 2600 Ft	LANDING ROLL: 3860 Ft

OBJECTIVE: To make inflight temperature measurements of various subsystems at maximum airspeed at an altitude of 20,000 feet. Adverse weather information on flight procedures and techniques were practiced at the end of the test run.

COMMENT: An instrument takeoff and climb to 20,000 feet were made using VFR takeoff procedures. The aircraft was accelerated to its maximum airspeed and maintained for 10 minutes, then decelerated to its maximum endurance airspeed and held for 15 minutes. Two holding patterns and penetrations were performed over the Yuma VOR station. A GCA was flown using VFR procedures.

FLIGHT TEST NR 8 (MISSION 5, LOW LEVEL, HIGH SPEED)

DATE: 30 Aug 60	MAX. AMBIENT TEMPERATURE: 111°F
FLT. TIME: 65 Minutes	T/O AMBIENT TEMPERATURE: 107°F
T/O ROLL: 2700 Ft	LANDING ROLL: 3825 Ft

OBJECTIVE: To provide extreme operating data on the various aircraft systems and evaluate the air-conditioning systems at high speed and high ambient temperature conditions.

Table 2 (Cont'd)

FLIGHT TEST NR 8 (MISSION 5, LOW LEVEL, HIGH SPEED) (Cont'd)

COMMENT: An instrument takeoff and climb to 2500 feet were made and the aircraft was stabilized at maximum military power for 15 minutes followed by a climb to 20,000 feet at military power and stabilized at maximum endurance airspeed for 15 minutes. The final portion of the test consisted of a stabilization for 15 minutes at cruise airspeed.

FLIGHT TEST NR 9 (MISSION 6, HIGH ALTITUDE, CRUISE AIRSPEED)

DATE: 2 Sep 60
 FLT. TIME: 105 Minutes
 T/O ROLL:

MAX. AMBIENT TEMPERATURE: 106°F
 T/O AMBIENT TEMPERATURE: 105°F
 LANDING ROLL: 3530 Ft

OBJECTIVE: To provide simulated design navigational training and normal operational data on all systems of the aircraft. Data was obtained for adverse weather during a portion of this mission.

COMMENT: After an instrument takeoff and military climb to 42,000 feet, the aircraft was held for 30 minutes at its best cruise airspeed (.885M). A descent to 30,000 feet was made and the aircraft held at its best cruise airspeed for 15 minutes followed by a descent to 20,000 feet and a practice penetration for GCA tests and single engine operation procedures.

FLIGHT TEST NR 10 (MISSION 5, REPEAT LOW-LEVEL HIGH SPEED)

DATE: 3 Sep 60
 FLT. TIME: 60 Minutes
 T/O ROLL: 2600 Ft

MAX. AMBIENT TEMPERATURE: 115°F
 T/O AMBIENT TEMPERATURE: 109°F
 LANDING ROLL: 3950 Ft

OBJECTIVE: To provide data during extreme operating conditions on the various aircraft systems.

COMMENT: An instrument takeoff and military climb to 2500 feet were made. The aircraft was stabilized at maximum military power for 10 minutes, followed by a military-power climb to 20,000 feet, and best cruise airspeed accomplished and held for 10 minutes. Then the aircraft was decelerated to its maximum endurance airspeed and held for 15 minutes.

(See Appendix D For Tabulated Data on this Mission)

FLIGHT TEST NR 11 (MISSION 7, CRUISE AIRSPEED)

DATE: 4 Sep 60
FLT. TIME: 75 Minutes
T/O ROLL: 2600 Ft

MAX. AMBIENT TEMPERATURE: 113°F
T/O AMBIENT TEMPERATURE: 110°F
LANDING ROLL: 3400 Ft

(See Appendix D For Tabulated Data on this Mission)

OBJECTIVE: To provide general operating data on the aircraft systems by flying at cruise airspeed at 35,000 and 20,000 feet altitude.

Following an instrument takeoff and military power climb to 35,000 feet, the aircraft was flown for 35 minutes at its best cruise airspeed. A descent to 20,000 feet was made and the aircraft was stabilized at its best cruise airspeed for 10 minutes. Adverse weather flight procedures and techniques were practiced during this mission.

APPENDIX C

STATIC TEMPERATURE SURVEY DATA

Over the weekend of 26-28 August, a static temperature survey was conducted by NALF at El Centro, California, for 60 consecutive hours. The tabulated data is presented in this appendix with selected compartment temperatures and ambient air temperatures presented in graphic form. (Reference paragraphs 17 and 18.)

Figure 2. Thermocouple Locations for the Static Temperature Survey.

Figure 3. Solar Radiation and Ambient Air Temperatures (26, 27, 28 August 1960).

Figure 4. Temperature Survey (Pilot and Co-Pilot).

Figure 5a. Canopy Surface Temperatures (Interior).

Figure 5b. Escape Systems Actuator Temperatures.

Figure 6. Aircraft Internal Temperatures.

APPENDIX D

FLIGHT TEST DATA

Selected data from two flights, Flight Test numbers 10 and 11, made by NALF at El Centro, California, September 3rd and 4th, respectively, are presented in this appendix. Flight Test number 10 was conducted at maximum military power at 2500 feet, and at best cruise airspeed and maximum endurance airspeed at 20,000 feet. Flight Test number 11 was conducted at best cruise airspeed at altitudes of 20,000 and 35,000 feet. The static temperature survey (ambient air temperatures and solar radiation for both flights) is presented in graphic form.

Figure 7. Solar Radiation and Ambient Air Temperatures (3 September 1960).

Figure 8. Solar Radiation and Ambient Air Temperatures (4 September 1960).
